

ITOPS-003 – Patch Management

The solution scans and patches vulnerabilities

Vulnerability patch scanners were configured in the infrastructure using the AWS System Manager module and its Patch Manager component. The Compliance Report was reviewed for this purpose.

For operational reasons, and to avoid installing an update that could affect business continuity, only the patch scanning and evaluation option was configured, and its installation was performed manually.

The screenshot shows the AWS Systems Manager Patch Manager interface. The breadcrumb navigation is "AWS Systems Manager > Patch Manager > Patches". The main heading is "Patch Manager" with an "Info" link. There are two buttons: "Patch now" and "Create patch policy". Below this is a section titled "Overview of patching operations - new". A navigation bar includes "Dashboard", "Compliance reporting", "Patch baselines", "Patches" (selected), "Patch groups", and "Settings". Under "Operating system", a dropdown menu shows "Windows". The "Patches (400+)" section has a search bar "Filter patches" and a pagination control showing page 38. A table lists patches with columns for "KB", "Name", and "Product".
