

ACCT-002 - Define identity security best practice on how to access customer environment by leveraging IAM

Depending on the user access permission configuration, we present best practices for maintaining user identity security. We maintain the minimum required roles or permissions, setting temporary credentials where applicable for accessing IAM roles. Each Partner administrator user must have dedicated credentials.

This AWS account uses the following default password policy:

Password minimum length
8 characters

Password strength

Include a minimum of three of the following mix of character types:

- Uppercase
- Lowercase
- Numbers
- Non-alphanumeric characters

Other requirements

- Never expire password
- Must not be identical to your AWS account name or email address

Security Token Service (STS) [info](#)

STS is used to create and provide trusted users with temporary security credentials that can control access to your AWS resources.

Session Tokens from the STS endpoints

AWS recommends using regional STS endpoints to reduce latency. Session tokens from regional STS endpoints are valid in all AWS Regions. If you use regional STS endpoints, no action is required. Session tokens from the global STS endpoint (<https://sts.amazonaws.com>) are valid only in AWS Regions that are enabled by default. If you intend to enable a new Region for your account, you can use session tokens from regional STS endpoints or activate the global STS endpoint to issue session tokens that are valid in all AWS Regions.

Grant least privileges

IAM users are defined and classified into groups based on the role or activities they can run in the console for the management and operation of current Seguros Patria workloads.

This definition is done similarly to the on-premises environment, although the use of IAM policies achieves greater control over the assigned privileges.
