

DOC-001 - Provide Architecture diagram designed with scalability and high availability

General Objective:

To design and implement a solution on AWS that allows migrating the customer's current workloads, including applications and databases, improving the performance and availability of the service.

This solution should allow the solution to be decoupled into separate components, including the application layer, database, and authentication

The architecture used for the implementation of Seguros Patria tool has the following main components:

- Microsoft SQL Server Database
- Microsoft IIS Server
- Microsoft Active Directory
- Elastic Block Store
- Elastic Load Balancer
- Certificate Manager
- Route53
- WAF
- Systems Manager
