

OPE-003 - Use consistent processes (e.g. checklist) to assess deployment readiness

In the same service a demo environment is configured, which is used for development, testing and presentation scenarios to future users of the tool.

The databases used for each of the environments mentioned above are separated in order to ensure the integrity and security of the information.

As best practices, the client has been recommended to implement a Test environment and/or develop DevOps in the organization to achieve comprehensive development on the platform.

At this stage of the project, only the production environment was included, but a subsequent stage involves creating a testing and QA environment for the Seguros Patria platform, which will reduce downtime for software and database updates and modernizations.
