

OPE-003 - Use consistent processes (e.g. checklist) to assess deployment readiness

The project includes the use of APP2Stream to deliver the application to our customers.

We have a separate dev environment where we test the changes before they get launched to production.

Changes are generated at the code level and stored in an s3 bucket

When a user makes use of the application, a custom website is built by means of a lambda function

The user authenticates through Cognito in order to identify their profile

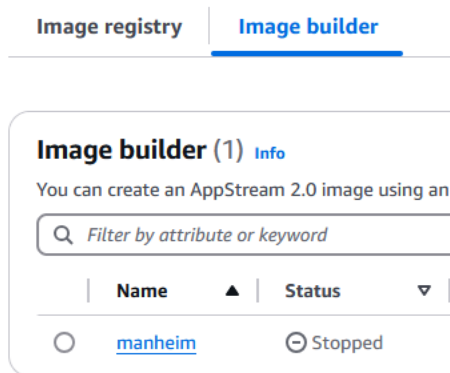

Image Builder used to test changes
